

AI Adoption in SMEs

Knowledge & Age

A **knowledge metric** has been created using various questions from the survey. The graphs shows the distribution of participants' level of AI knowledge. This metric will be used to find the correlation between SME employee's **knowledge of AI** and their **willingness to learn** more about AI.

After calculating the **willingness metric**, it was observed that the average willingness score for each group is similar, with a slight **decrease** after **age 44**.

Willingness to learn

A **willingness metric** was calculated using responses from the survey. The distribution is shown on the top left side. This metric is used alongside the **knowledge metric** distribution and age distribution to discover relationships.

On the bottom left, the correlation between a SME employee's **existing AI knowledge** and their **willingness to learn** more about AI is shown. The correlation is around 0.4. This indicates that existing knowledge about generative AI is related to employee's willingness to learn.

Concerns

The limiting factors expressed by employees highlighted by the research include **lack of knowledge**, **lack of time**, **data privacy concerns** and **fear of generative AI become the main source of information**. The word cloud shows the most used key words throughout each interview.

Recommendations

- Provide **foundational training**: offer a basic tutorial or introductory course on AI concepts
- Encourage **self-paced learning**: recommend accessible resources like videos, online courses etc.
- Diversify** learning materials
- Increase **management support**: assess and enhance management's role in supporting AI training
- Regularly **review** training opportunities: regularly evaluate and update available training resources
