

# Environment & Poetry Setup Instructions (Windows + Conda)

Follow these steps **exactly** to replicate the working environment for the MVP package.

---

## 1. Set up miniconda3

miniconda3 python 3.9 version - [https://repo.anaconda.com/miniconda/Miniconda3-py39\\_24.1.2-0-Windows-x86\\_64.exe](https://repo.anaconda.com/miniconda/Miniconda3-py39_24.1.2-0-Windows-x86_64.exe)

You should set the setting in the installer so that it adds it to the path variables, also remove it from registering it as a default python 3.9 version.

Make sure that the miniconda3 path is in the system environment variable paths list, and make sure that while working on this project these paths are on top of any other existing python paths

-

C:\Users\Endijs\miniconda3

C:\Users\Endijs\miniconda3\Scripts

C:\Users\Endijs\miniconda3\Library\bin

Make sure it is set up properly using Windows PowerShell -

C:\Users\Endijs>Get-Command python

CommandType Name Version Source

---

Application pip.exe 0.0.0.0 C:\Users\Endijs\miniconda3...

C:\Users\Endijs>Get-Command pip

CommandType Name Version Source

---

Application pip.exe 0.0.0.0 C:\Users\Endijs\miniconda3...

```
C:\Users\Endijs>python --version
```

```
Python 3.9.x
```

## 2. Get cv\_env.yml file

Download cv\_env.yml from github.

As **we are using a working conda-based setup (cv\_env)** and mixing in poetry to manage the installable package we **need** both the **.toml file** and the **cv\_env.yml** file, because we are using **non-PyPI packages** (e.g., opencv-contrib-python, torch with CUDA), **conda-forged** compatibility and other packages not easily managed with Poetry alone.

## 3. Set up the conda environment

```
In PowerShell cv_env.yml dir
conda env create -f cv_env.yml
conda activate cv_env
```
